

Running a Virus Scan: Mac OSX 10.x

1. Drag the eicar_com.zip test file from www.eicar.com to the “Drop items or click here.” Box in VirusScan and Click the Start button. The .zip file will be scanned, and should find the test virus file in the .zip container. Click the triangle below the drop box to see details of the virus scan.

2. If the test file was properly identified, VirusScan should be ready to go. By default, it is set to update its virus database daily by ftp from a McAfee server.

Note: Since VirusScan updates through FTP to a McAfee server, users on Resnet must register with the Bradford before they will be able to update their virus definitions or anti-virus software.

Note: Although the application is known as VirusScan from McAfee, it appears in the /Library/StartupItems folder as Virex. That is a name used for older versions of the application.
